

How our coding harness works

The AI only suggests. The harness decides. At the end, the harness checks everything itself.

Tests run in a locked box
(a Docker container)

- no internet
- code is read-only
- not an admin
- time limit
- thrown away after

Hard limits = brakes
so a confused AI can't run forever

- 30 steps
- 6 bad replies
- 6 refusals
- 12k characters back

Why check it ourselves?
a real run with the small 7B model:

secret test: FAILED

The AI's word is not proof.
